

Module 02 - App Shell & Dashboard

Responsive navigation, global layout, aggregate overview

SOURCE OF TRUTH: This resource intentionally uses plain JavaScript. The locked stack is React + JavaScript + Firebase + Material UI (MUI). Do not introduce Next.js, TypeScript, shadcn/ui, Redux, or another backend framework unless the project owner explicitly changes this specification.

Scope

Create the persistent logged-in shell with sidebar navigation on desktop, mobile drawer on small screens, top bar, user menu, breadcrumbs where useful, and a dashboard that summarizes upcoming plans, groups, bookings, and money status.

Navigation

Dashboard
My Plans
Groups
Bookings
Expenses
Notifications
Settings

Responsive behavior

- Desktop: fixed or sticky left navigation + main content.
- Tablet: collapsible navigation.
- Mobile: MUI Drawer or temporary navigation opened by menu button.
- No horizontal overflow from tables/cards.

Dashboard cards

Card	Source	Example
Upcoming plans	plans where memberId is current user	3
Groups	group memberships	5
Money owed	computed from expense splits	■2,450
Money to receive	computed from balances	■1,200

Dashboard sections

- Upcoming Plans list
- Recent Activity feed
- Outstanding Balances summary
- Quick actions: Create Plan / Create Group / Add Expense

Data strategy

Prefer targeted queries and derived summaries rather than downloading every group record. For early MVP, compute a small number of user-scoped summaries. Later, add denormalized summary documents if query volume becomes large.

Acceptance criteria

- Refresh preserves current user and data.
- Dashboard looks complete with demo data on first run.
- New user with no data sees intentional empty states rather than broken cards.
- Sidebar highlights current route.
- Mobile navigation works without page reload.
