

Module 06 - Booking Management

Record movie, hotel, travel, restaurant, and other bookings

SOURCE OF TRUTH: This resource intentionally uses plain JavaScript. The locked stack is React + JavaScript + Firebase + Material UI (MUI). Do not introduce Next.js, TypeScript, shadcn/ui, Redux, or another backend framework unless the project owner explicitly changes this specification.

Scope

V1 is a booking management layer, not a real ticketing marketplace. Users record booking details and participants, connect bookings to plans, and optionally create an expense from the booking.

Booking document

```
groups/{groupId}/bookings/{bookingId}
{
  planId,
  type: "movie" | "hotel" | "flight" | "restaurant" | "other",
  title,
  provider,
  referenceCode,
  scheduledAt,
  location,
  totalAmount,
  currency,
  bookedBy,
  notes,
  createdAt,
  updatedAt
}
```

Participants

```
.../bookings/{bookingId}/participants/{uid}
{ uid, shareMode, shareValue }
```

Booking CRUD

- Create booking
- Edit booking
- Delete booking
- View booking
- Attach to plan
- Select participants
- Create expense from booking

Booking detail UI

- Header summary
- Provider/reference code
- Date/time
- Location
- Participants
- Cost summary

- Actions: Edit, Delete, Create Expense

Important rule

Never imply that the app actually purchased a movie ticket, hotel, flight, or restaurant reservation unless a real external integration has been implemented. Label V1 records as managed booking information.

Acceptance criteria

- Booking can be associated with a plan.
- Participants are validated against group/plan membership.
- Total amount is numeric and non-negative.
- Deleting a booking does not silently delete associated financial records.
- Booking expense creation copies a snapshot of title/amount but remains a separate expense record.
